Risk Prevention To-Do List

Manokshmi Technologies - RestroBill, ClothBill, BarBill and the licensing platform

Prepared 19 October 2026. Page 1 is the brief checklist. Pages 2 onward give the detail for each task.

Brief checklist (tick each box when done)

THIS WEEK	
[ ]	Install RestroBill v0.1.55 at the hotel and create Owner and Staff logins (Settings).
[ ]	Turn on two-step login for GitHub, Cloudflare and Gmail.
[ ]	Back up the signing key (restaurant-billing.key) and its password in two places.
[ ]	Set up weekly backup copies to a pendrive or Google Drive for every customer.
[ ]	Test every release on your own PC before publishing; give it to one customer first.
[ ]	Check the Production deployment of the licensing site uses branch 'production'.

THIS MONTH	
[ ]	Build RestroBill v0.1.56: bills insert-only, plus a separate bill journal file, plus gap warning.
[ ]	Buy your own domain; point it at the licensing site; use it in all apps.
[ ]	Keep a full copy of all project folders on a pendrive; mirror the code to a second service.
[ ]	Export the licence list (CSV) and the licensing database once a month.
[ ]	Write a customer agreement and get it checked by a lawyer or CA.
[ ]	Write the support routine (how to collect logs, remote access, reply times).
[ ]	Test the apps on an older Windows 10 PC.

BEFORE YOU GROW	
[ ]	Buy a code-signing certificate to remove 'unknown publisher' warnings.
[ ]	Check excise and GST rules for the bar and restaurant products with a CA or consultant.
[ ]	Plan automatic cloud backup for customers who want it.
[ ]	Keep a freelance developer's contact for emergencies and code review.
[ ]	Review every platform's terms (GitHub, Cloudflare, AI tool) with a lawyer.

Detailed tasks

1. Customer data loss (the most serious risk)

What went wrong: bills 14 and 21 vanished at the hotel. RestroBill rewrites the whole database from memory on every save, so if memory is ever wrong the real bill is deleted from disk. v0.1.55 adds protections but the root cause is not yet proven.

[ ] 1.1 Get v0.1.55 live at the hotel

HIGH | This week

Why: It contains the bill guard (keeps bills missing from memory), the bill watcher log, and owner-only delete with a reason.

How:

- On GitHub Releases, check v0.1.55 has the .exe, .msi and latest.json and is published (not draft).
- Install it on the hotel PC (or accept the in-app update). Confirm the version shows 0.1.55 in the app.
- In Settings, create an Owner account for you and a Staff account for the counter. Keep the Owner PIN private.
- If a bill goes missing or a 'restored' message appears, send the last 20 lines of bill-audit.log from Documents\Manokshmi RestroBill Backups.

[ ] 1.2 Weekly backup copy off the PC

HIGH | This week

Why: Daily backups are saved on the same PC. If the disk fails or the PC is stolen, they are lost too.

How:

- Every Sunday, copy the newest backup file from Documents\Manokshmi RestroBill Backups to a pendrive or Google Drive.
- Use the Settings export button (JSON) as the second copy.
- Set a repeating phone reminder for the owner, and ask them to confirm once a month.
- Do the same for ClothBill (Manokshmi ClothBill Backups) and BarBill (Manokshmi BarBill Backups).

[ ] 1.3 Daily reconciliation habit

MEDIUM | This week

Why: Catches a missing bill the same day, not a week later.

How:

- Each night the owner opens the Day Closing Report and checks: bills run 1, 2, 3 with no gaps, and the cash matches.
- Any gap is noted with the time it happened, and reported to you the same day.

[ ] 1.4 Build RestroBill v0.1.56 (safer saving)

HIGH | This month

Why: This removes the cause: the routine save must never delete a bill.

How:

- Make bills insert-only; routine saves never delete. Only the Owner's Delete (with reason) can.
- Write every finished bill to a plain journal file in Documents as well, and rebuild any missing bill from it.
- Show a clear warning the moment a bill number is skipped or a bill is missing.
- Test on your own PC and on the hotel PC for several days before releasing to other customers.

[ ] 1.5 Prove the restore works

MEDIUM | This month

Why: A backup you have never restored is only a hope.

How:

- On your own PC, restore a recent backup using Settings and check that bills and totals match.
- Do this once a month and after every big release.

2. A bad update reaching every customer

[ ] 2.1 Release routine (never skip) — HIGH — Every release

Why: Updates install automatically, so one broken release can stop every customer at once.

How:

- Push the tag, wait for the green build, open the draft release and check the .exe, .msi and latest.json are present.
- Install the .exe on your own PC. Create a bill, print, close and reopen the app, confirm data is still there.
- Only then press Publish release.
- Give the new version to one friendly customer for 2 to 3 days before the others get it (keep the release as draft, install by hand at first).
- Keep the previous installer file so you can reinstall it if needed.

[ ] 2.2 Never edit old database migrations — MEDIUM — Always

Why: Changing a migration that customers have already run can corrupt their data.

How:

- A schema change is always a new migration file (0007, 0008, ...) registered in main.rs.
- Never edit 0001 to 0006 after a customer has used them.

3. Signing key and passwords

[ ] 3.1 Back up the signing key — HIGH — This week

Why: The public key is built into every installed app. If the private key or its password is lost, no update can ever install, and every customer must reinstall by hand.

How:

- Copy C:\Users\samar\.tauri\restaurant-billing.key to a pendrive kept at home, and to a second place (for example a password manager's secure file).
- Write the key password in a password manager; do not keep it only in your head or in a chat.
- Never upload the key to GitHub, chat or email. The repo's .gitignore already excludes *.key.
- Check the GitHub secrets TAURI_SIGNING_PRIVATE_KEY and TAURI_SIGNING_PRIVATE_KEY_PASSWORD still match.

4. Account security (GitHub, Cloudflare, Gmail)

[ ] 4.1 Turn on two-step login everywhere — HIGH — This week

Why: Whoever controls your GitHub could push a harmful update to all customers; whoever controls Cloudflare could change or revoke licences.

How:

- Enable two-step login on GitHub, Cloudflare and the Gmail used for them.
- Use a strong, different password for each, stored in a password manager.
- Save the recovery codes offline (printed or on a pendrive).
- Keep ADMIN_SECRET known only to you; change it if you ever shared it.

5. Licensing server and domain

[ ] 5.1 Use your own domain — MEDIUM — This month

Why: Every app has licensing-platform.pages.dev built in. If that address is lost, installed apps cannot be redirected without an update.

How:

- Buy a domain for Manokshmi Technologies and point it at the licensing Cloudflare Pages project.
- Make a release of each app that uses your domain for licence checks (and later for updates).
- Do this before you have many customers, because changing the address later means updating every install.

[ ] 5.2 Deploy to production correctly — MEDIUM — Every deploy

Why: Deploying without the right branch goes to Preview and the live site does not change.

How:

- Always run: npx wrangler pages deploy . --project-name licensing-platform --branch production --commit-dirty=true
- In Cloudflare Deployments, the newest entry must say Production with branch production.

[ ] 5.3 Back up licences and the database — MEDIUM — Monthly

Why: If the licence database is lost, you lose the record of who owns what.

How:

- Once a month, export the licence list as CSV from the admin page and store it with your other backups.
- Also export the D1 database with wrangler (check the exact command and database name in Cloudflare) and save the file.
- Remember: apps only lock on an explicit 'revoked' or 'expired' reply, so a server outage never locks customers out.

6. Platform dependency (GitHub, Cloudflare, AI tool)

[ ] 6.1 Keep your own copies of everything — MEDIUM — This month

Why: An account suspension should not take the business with it.

How:

- Copy the project folders (RestroBill, ClothBill, BarBill, licensing-platform) to a pendrive or external drive monthly.
- Keep a mirror of each repo on a second service (for example GitLab).
- Keep every released installer and its .sig file.

[ ] 6.2 Reduce dependence on one AI tool — MEDIUM — Ongoing

Why: You rely on an AI tool for engineering, and the service could change or be unavailable.

How:

- Keep the handoff files up to date for each product (what it does, where things are, how to release).
- Test every release on a real PC; do not trust a fix just because the code looks right.
- Keep a freelance developer's contact for emergencies and an occasional code review.

7. Tauri and Windows technical risks

[ ] 7.1 Test on other Windows PCs — MEDIUM — This month

Why: The app screen uses Windows' WebView2 component and behaviour can differ by PC.

How:

- Test each product on an older Windows 10 PC and on Windows 11 before selling widely.
- Check printing on the real thermal printer the customer uses.

[ ] 7.2 Do not upgrade Tauri casually — LATER — Ongoing

Why: A major upgrade can change how plugins, permissions and the database behave.

How:

- Keep Cargo.lock committed so builds stay the same.
- Upgrade only in a planned release, and test it fully on a real PC first.

[ ] 7.3 Code-signing certificate — LATER — Before you grow

Why: Without it Windows or antivirus may show 'unknown publisher' or flag the installer.

How:

- When you have several customers, buy a code-signing certificate and sign the installers.

8. Support and business

[ ] 8.1 Write the support routine — MEDIUM — This month

Why: You are the only support person, so every problem comes to you first.

How:

- List: how to collect log files (debug.log, bill-audit.log), how you connect remotely (for example AnyDesk), and your reply times.
- Keep a short record of every problem and its fix, so the same issue is solved faster next time.
- Charge a yearly support fee so support time is paid for.

[ ] 8.2 Be open with customers — MEDIUM — Always

Why: Trust is lost by silence, not by bugs.

How:

- Tell the customer what you found, what you changed, and what you need from them. Do not promise what is not yet proven.

9. Legal and compliance

[ ] 9.1 Customer agreement — MEDIUM — This month

Why: If a bill is wrong or data is lost, a customer may blame you for lost sales or tax trouble.

How:

- Write a short agreement: what you provide, support terms, a limit on your liability, and that the customer is responsible for their own backups.
- Have a lawyer or CA review it before you sign it with customers. (This list is not legal advice.)

[ ] 9.2 Tax and excise checks — LATER — Before you grow

Why: Bill numbering, GST invoice format and, for BarBill, excise registers must follow current rules.

How:

- Ask a CA to check the bill format and number sequence for GST.
- Ask an excise consultant or a pilot bar to check the excise register and monthly return before promising compliance.

[ ] 9.3 Terms of the platforms you use — LATER — Before you grow

Why: Terms on code ownership, usage and account suspension can matter for a business.

How:

- Have a lawyer read the terms of GitHub, Cloudflare and your AI tool once, and tell you what to watch for.

Rule of thumb: test it on your own PC, release it to one customer first, keep backups in two places, and tell customers the truth quickly.
